

Week 4: Interaction I

Week 1

Course Description

Hypertextis Markup Language Extensible Markup Language Cascading Style Sheets bavaSeriot

Hypertext Markup Language

```
<!doctype html>
<html lang="en">
 <head>
   <title>What Screens Want</title>
   k rel="stylesheet" href="styles/style.css">
 </head>
 <body>
   <div class="container">
     <!-- Start of navigation element -->
     <header class="site-header">
       <nav>
         ul class="navigation">
           <a href="design.htm-</pre>
```

Cascading Style Sheets

```
body {
  color: #555;
  font-family: sans-serif;
  margin: 0;
a {
  color: #999;
  text-decoration: none;
.logo-text {
  font-size: 1em;
  margin: 0;
```

JavaScript

console.log('Welcome to Developer Tools.
JavaScript loaded from main.js!');

JavaScript

console.log('Welcome to Developer Tools.
JavaScript loaded from main.js!');

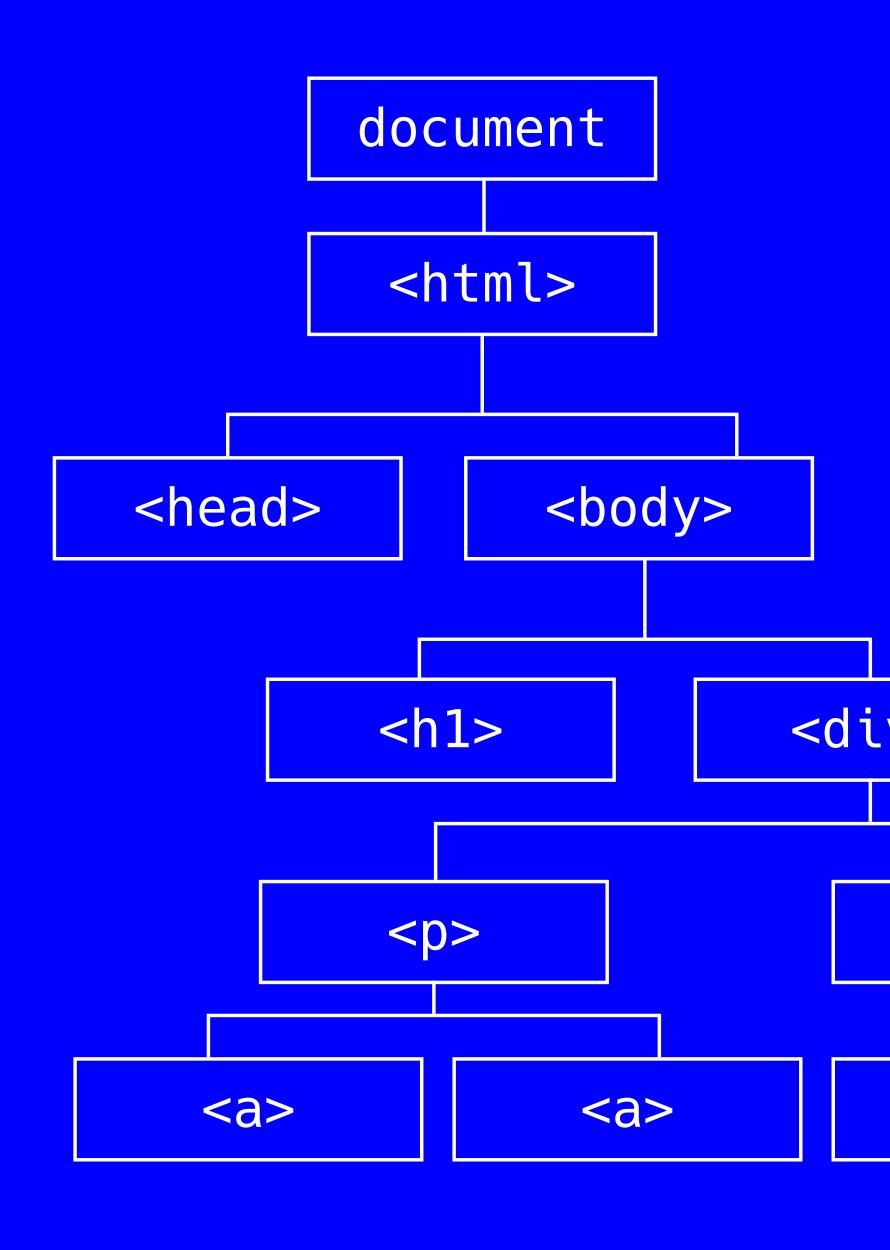

- → AHH!! Nothing is happening!!
- → Chrome: 第十七十 P
- 今 Safari: 육 + 七 나 C

Document Object Model

A cross-platform programming interface that treats an HTML document as a tree structure where in each node is an object representing a part of the document.

The DOM model represents a document with a logical tree.

Each branch of the tree ends in a node, and each node contains objects. DOM methods allow programmatic access to the tree; with them you can change the document's structure, style or content.

JavaScript

JavaScript is a programming language that allows you to implement complex things on web pages. Every time a web page does more than just sit there and display static information for you to look at—displaying timely content updates, or interactive maps, or animated 2D/3D graphics, or scrolling video jukeboxes, and so on—you can bet that JavaScript is probably involved.

→ Client-side and Back-end
 → Java ≠ JavaSript

Skipping History (Again)

- 3 December, 1995
- → Netscape
- → DHTML
- \rightarrow ...
- → Libraries (jQuery, React, Vue.js)
- > Node.js
- → ES5, ES6

Skipping History (Again)

- → Canvas, WebGL, Service Workers, Video, Audio, Storage
- \rightarrow ...
- → JavaScript is Eating the World

Interaction: CSS

```
body {
  color: #555;
  font-family: sans-serif;
  margin: 0;
a {
  color: #999;
  text-decoration: none;
.logo-text {
  font-size: 1em;
  margin: 0;
```

Pseudo-class

:hover

:active

:visited

: focus

• • •

Interaction: CSS

Store Name

```
.store-item-button {
  font-size: 100px;
  color: red;
  padding: 1em;
  background: blue;
}
```

Store Link

```
.store-link {
  text-decoration: none;
  color: red;
}
```

Store Name

```
.store-item-button:hover {
  color: white;
  background: red;
}
```

Store Link

```
.store-link:hover {
  text-decoration: underline;
  color: orange;
}
```

Interaction: CSS

```
.item-block {
 width: 100px;
 height: 100px;
 background: green;
```

```
.item-block:hover {
  width: 600px;
  height: 400px;
  border: 10px solid red;
}
```

- > More complex interactivity
- > Calculations
- > Conditions
- > Extensibility
- \rightarrow ...
- > Much more!

Variable

Variables are containers that you can store values in. A **variable** is a value that is subject to change, depending on conditions or on information passed to the program.

Can be a: String Array
Number Object
Boolean

→ StringNumberBooleanArrayObject

/ar myVariable = 'Hello';

String→ NumberBooleanArrayObject

```
var myVariable = 'Hello';

> var myNumber = 10;
```

```
String
Number

→ Boolean
Array
Object
```

```
var myVariable = 'Hello';
var myNumber = 10;
> var myBoolean = true;
```

```
String
Number
Boolean
Array
Object
```

```
var myVariable = 'Hello';
var myNumber = 10;
var myBoolean = true;
> var myArray =
    ['mango','cheetos',
    'apple'];
```

String
Number
Boolean
Array
→ Object

```
var myVariable = 'Hello';
var myNumber = 10;
var myBoolean = true;
var myArray =
   ['mango','cheetos',
    'apple'];
var my0bj =
   document.
   querySelector('h1');
```

Operators

An operator is a mathematical symbol which produces a result based on two values (or variables).

Can be a: Addition

Subtraction

Multiplication

Division

Assignment

Equality

Not

Does-not-equal

Addition + 2 + 5 = 7Subtraction - 5 - 2 = 3Multiplication * 3 * 4 = 12Division / 4 / 2 = 2

Assignment = variable = 'Hello';

Equality === var1 === var2

Not ! (var1 === var2)

Does-not-equal !== var1 !== 10

Function

Functions are a way of packaging functionality that you wish to reuse. When you need the procedure you can call a function, with the function name, instead of rewriting the entire code each time.

No functions in HTML or CSS.

```
JavaScript: Terms
                            Arguments, 2 of them!
function multiply(num1, num2) {
  var result = num1 * num2;
  return result;
```

```
multiply(4, 7);
```

Conditionals

Conditionals are code structures which allow you to test if an expression returns true or not, running alternative code revealed by its result.

A very common form of conditionals is the if...else statement.

```
var city = 'toronto';

if (city === 'toronto') {
   alert('The city that we are in!');
} else {
   alert('We are somewhere else?');
}
```

Events

These are code structures which listen for things happening in browser, running code in response.

We'll be seeing these often!

```
var | myElement = document.querySelector('.click-item');
myElement.addEventListener("click", function( event ) {
  alert('You clicked on this item!');
myElement.addEventListener("mouseover", function( event ) {
  alert('Your mouse is on this item!');
```

- → { and (should always closed!!
- → Objects everywhere!
- + Random
- > It's all text
- → Test, run, debug in browser
- Hany ways of doing one thing
- > Rabbit hole

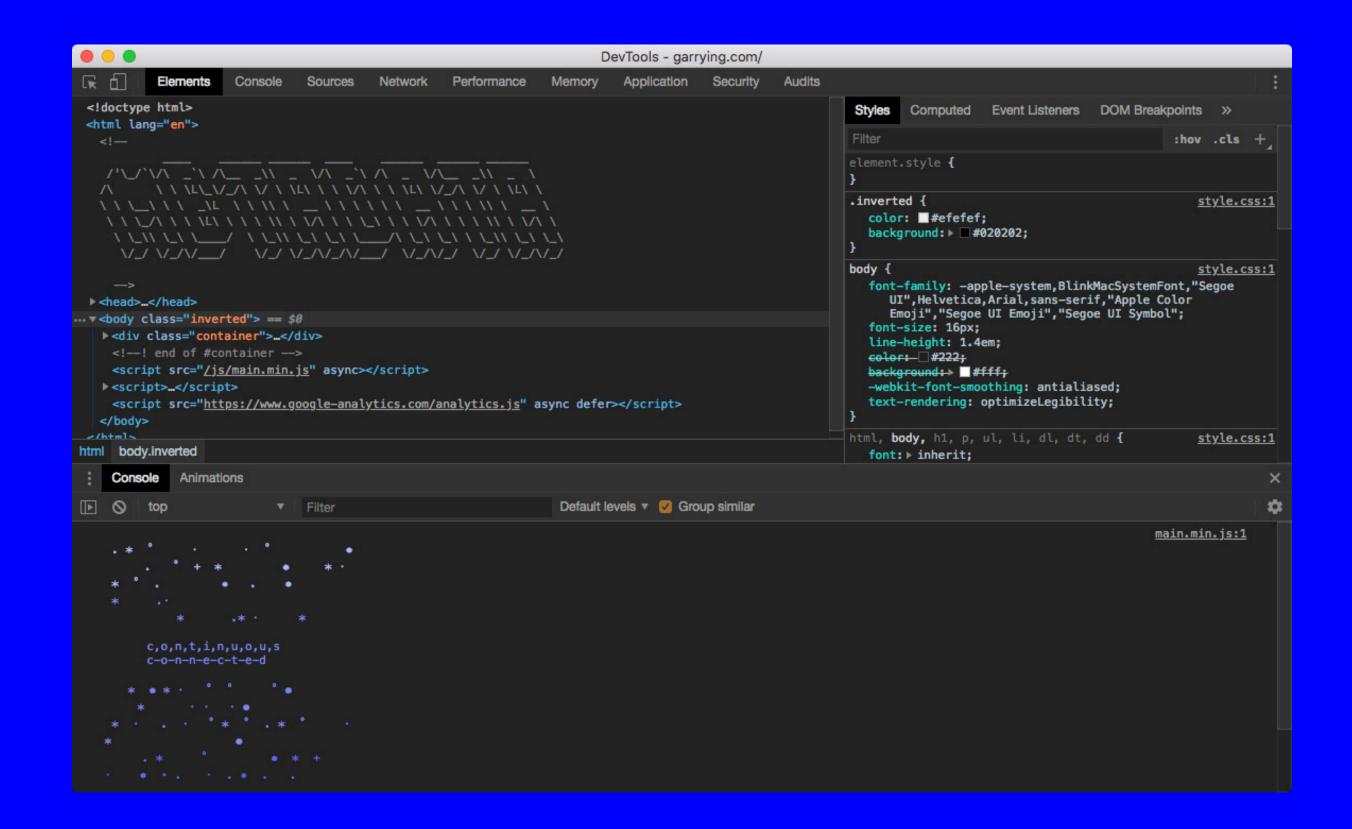

- → jQuery
- 3 January-ish, 2006
- 3 John Resig

→ Straight JavaScript for now

```
Properties, and parameters
      Selector
$('p').css('color', 'green');
               Method (Action)
```

```
Interaction: JavaScript
                                       Selector
var element = document.querySelector('p');
element.forEach(function(item) {
  item.style.cssText = "color: green";
});
                 Method (Action)
                           Properties, and parameters
```

JavaScript: Console

→ Chrome: # + ~ + P
 → Safari: # + ~ + C

Five tasks to try

- -> Click on the page to change the background color
- > Click on an element to make it fade out
- → Create a balloon in HTML/CSS & pop it with a click
- > Hover on an image to replace it with another
- -> Click on the page to add a background image
